## Goal: *de novo* cluster Nanopore reads per expressed genes

**Data:** Nanopore 1D reads from mouse transcriptome sequenced with MinION (accession number: ERP107503)

### Results:

- ★ State of the art does not perform well on ONT reads
- ★ We introduce CARNAC-LR, a new clustering approach designed for long reads
- ★ Validations on mouse transcriptome

### Benchmark 1: community detection algorithms

	Recall	Precision	Jaccard index
Single link	76%	<15%	<0.1
Louvain	89%	<15%	<0.1
Modularity	61%	<75%	<0.5
CPM	79%	<75%	<0.5
CARNAC-LR	65%	98%	0.79

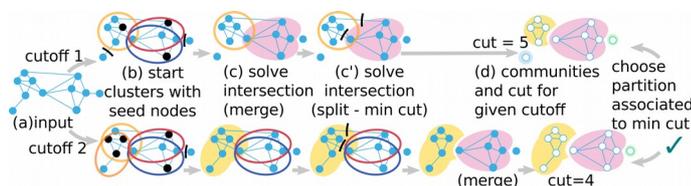

### Benchmark 2: sequence clustering tools

	Recall	Precision	Status
Starcode	NA	NA	error
Tofu	NA	NA	not applicable
SEED	0	0	run
CD-HIT	27%	99%	run
CARNAC-LR	65%	98%	run

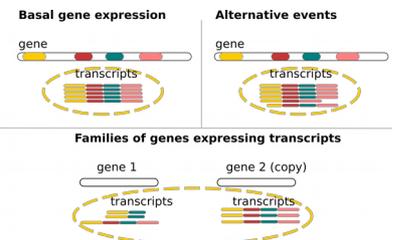

### Algorithm overview:

#### Key ideas:

- maximize local edge density
- minimize cut size
- partition the graph

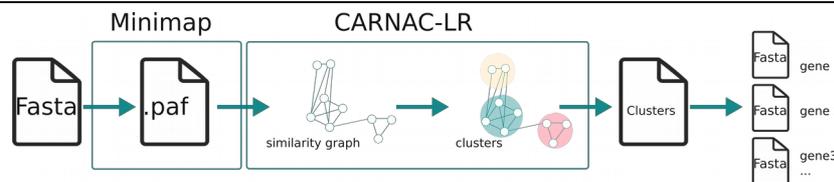

### Expected clusters:

### Pipeline overview:

From reads to clusters per expressed gene

- ★ C++11 and Python 3
- ★ GPL license
- ★ available on Github

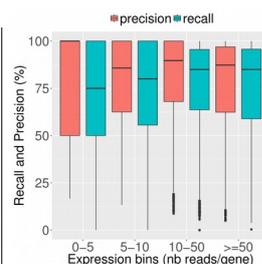

### Results on whole mouse transcriptome:

Output graphical example for mouse Picp5 gene

#### Performances:

- For 1 million reads
- wallclock 3 hours (40 threads)
- memory: 30G

Clusters **purity** and **completeness** assessed using mapping strategy (BLAT+est2genome)

### Work in progress:

#### Goals:

- Identify alternative isoforms from CARNAC-LR's clusters
- Propose one consensus per isoform

#### Key ideas:

- intra-cluster multiple sequence alignment
- detect alternative blocks (exons)
- separated block consensus computation

MSA with sequences from 1 cluster

consensus per exon
  
```

### Main achievements

- ★ Clusters *de novo* ONT reads by expressed genes
- ★ Scales a whole mouse transcriptome
- ★ Performs better than state of the art on ONT reads
- ★ Validated using comparison by mapping strategy on real data
