

# Distributed local strategies in broadcast networks

Nathalie Bertrand  
Inria Rennes, France

joint work with Paulin Fournier and Arnaud Sangnier

CDPS, August 2016, Singapore

# Motivation

## Verification of networks of processes of unbounded size

### Why considering such networks?

- ▶ Distributed algorithms (*mutual exclusion, leader election,...*)
- ▶ Telecommunication protocols (*routing,...*)
- ▶ Algorithms for ad-hoc networks
- ▶ Biological systems
- ▶ ...

# Crowd networks

**All the processes have the same behavior**

They form a **crowd** [Esparza, STACS'14]

More precisely:

- ▶ Every process follows a same given protocol
- ▶ Processes can communicate, by either
  - ▶ Message passing
  - ▶ Shared variables
  - ▶ Rendez-vous communications
  - ▶ **Broadcast communications**
  - ▶ **Multi-diffusion (selective broadcasts)**

**Question:**

**Is a goal reachable in some network with  $N$  processes ?**

# This talk

## Decidability and complexity of reachability problems in parameterized networks

### Features:

- ▶ Simple protocols with broadcast communication
- ▶ Simple reachability questions
- ▶ **Taking into account some *locality* assumptions**

# Outline

- 1 Networks of reconfigurable broadcast protocols
- 2 Restricting to local strategies
- 3 Conclusion

# Outline

- 1 Networks of reconfigurable broadcast protocols
- 2 Restricting to local strategies
- 3 Conclusion

# A model for reconfigurable broadcast networks

## Main characteristics

[Delzanno *et al.* CONCUR'10]

- No creation/deletion of nodes
- Each node executes the same finite state process
- Broadcast of the messages to the neighbors
- Communication topology evolves non-deterministically

# Reconfigurable Broadcast Networks: syntax

## A protocol

Finite state automaton. Transitions labelled with:

1. broadcast of messages -  $!!m$
2. reception of messages -  $??m$
3. internal actions -  $\epsilon$

**A protocol defines a reconfigurable broadcast network**

# Configurations

A configuration is a vector of arbitrary size

- ▶ **Initial configurations:** **all** vertices labelled with the initial state
- ▶ *Notation* :  $\text{lab}(\gamma)$  for all the labels present in  $\gamma$

## Remarks:

- ▶ Size of configurations is not bounded

⇒ **Broadcast networks are infinite state systems**

# Reconfigurable Broadcast Networks: semantics

## Transition system associated with $P$

- ▶  $\mathcal{C}$  : set of configurations
- ▶  $\mathcal{C}_0$  : set of initial configurations
- ▶  $\rightarrow$ :  $\mathcal{C} \times \mathcal{C}$  : transition relation
  - ▶ Choice a of process
  - ▶ Choice of a neighbor set
  - ▶ Execution of an action

# Reconfigurable Broadcast Networks: semantics

## Transition system associated with $P$

- ▶  $\mathcal{C}$  : set of configurations
- ▶  $\mathcal{C}_0$  : set of initial configurations
- ▶  $\rightarrow$ :  $\mathcal{C} \times \mathcal{C}$  : transition relation
  - ▶ Choice a of process
  - ▶ Choice of a neighbor set
  - ▶ Execution of an action

## Characteristics

- ▶ The number of vertices does not change
- ▶ Two kinds of transitions
  1. **local actions** - one process performs an internal action  $\varepsilon$
  2. **broadcast** - one process emits a message with  $!!m$ , all its neighbors that can receive it with  $??m$  must receive it

# Reconfigurable Broadcast Networks: an example

# Parameterized reachability

**Parameter:** Number of processes

## Control State Reachability (REACH)

**Input:** A protocol and a control state  $q$ ;

**Output:** Does there exist  $\gamma \in \mathcal{C}_0$  and  $\gamma' \in \mathcal{C}$  s.t.  
 $\gamma \rightarrow^* \gamma'$  and  $q \in \text{lab}(\gamma')$ ?

# Parameterized reachability

**Parameter:** Number of processes

## Control State Reachability (REACH)

**Input:** A protocol and a control state  $q$ ;

**Output:** Does there exist  $\gamma \in \mathcal{C}_0$  and  $\gamma' \in \mathcal{C}$  s.t.  
 $\gamma \rightarrow^* \gamma'$  and  $q \in \text{lab}(\gamma')$ ?

### Remarks:

- ▶ Infinite number of possible initial configurations
- ▶ Reachability of a given configuration  $\gamma'$  is easy, since **the number of processes is fixed**

# Parameterized reachability

**Parameter:** Number of processes

## Control State Reachability (REACH)

**Input:** A protocol and a control state  $q$ ;

**Output:** Does there exist  $\gamma \in \mathcal{C}_0$  and  $\gamma' \in \mathcal{C}$  s.t.  
 $\gamma \rightarrow^* \gamma'$  and  $q \in \text{lab}(\gamma')$ ?

### Remarks:

- ▶ Infinite number of possible initial configurations
- ▶ Reachability of a given configuration  $\gamma'$  is easy, since **the number of processes is fixed**

### Theorem

[Delzanno et al. FSTTCS'12]

REACH is PTIME-complete for reconfigurable broadcast networks

# Outline

- 1 Networks of reconfigurable broadcast protocols
- 2 Restricting to local strategies
- 3 Conclusion

# Local strategies

## Processes do not really behave the same!

- ▶ They all follow the same protocol  $P$ , yet...
- ▶ ... if the protocol is non-deterministic, each process can take a different choice!

# Local strategies

## Processes do not really behave the same!

- ▶ They all follow the same protocol  $P$ , yet...
- ▶ ... if the protocol is non-deterministic, each process can take a different choice!

**Local strategies dictate processes what to do  
given their (local) past**

**Two processes with same past behave similarly**

Local strategy  $\sigma = (\sigma_a, \sigma_r)$

- ▶  $\sigma_a : \text{Path}(P) \mapsto (Q \times (\{\!\!|m\} \cup \{\varepsilon\}) \times Q)$  active actions
- ▶  $\sigma_r : \text{Path}(P) \times \Sigma \mapsto (Q \times \{\!\!??m\} \times Q)$  receptions

# Reachability question under local strategies

**An execution respects a local strategy iff  
each process chooses transitions as given by the strategy**

## Control State Reachability (REACH[L])

**Input:** A protocol and a control state  $q \in Q$ ;

**Output:** Does there exist  $\gamma \in \mathcal{C}_0$  and  $\gamma' \in \mathcal{C}$  and a local strategy  $\sigma$  s.t.  $\gamma \rightarrow^* \gamma'$  respects  $\sigma$  and  $q \in \text{lab}(\gamma')$ ?

# Local strategies on an example

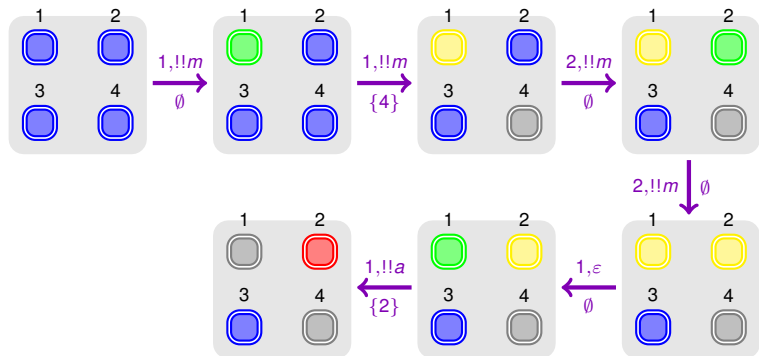

- ▶ There is no local strategy to reach  $q_4$ 
  - ▶ from  $q_0$ , either all processes move to  $q_1$ , or they all move to  $q_3$

# Local strategies on an example

- ▶ There is no local strategy to reach  $q_4$ 
  - ▶ from  $q_0$ , either all processes move to  $q_1$ , or they all move to  $q_3$
- ▶ There exists a local strategy to reach  $q_6$

# Local executions on an example

# Local executions on an example

# Strategy patterns for reconfigurable networks

## Local strategies can be represented by trees

- ▶ Each path in the tree is a path in the unfolded protocol
- ▶ From each node in the tree:
  - ▶ **At most one outgoing edge is labelled by an active action (broadcast or internal action)**
  - ▶ **At most one outgoing edge labelled  $m$  per message  $m$**
- ▶ Strategy patterns are underspecified local strategies: they may represent several local strategies

# Example of strategy patterns

# Admissible strategy patterns

## An admissible strategy pattern

- ▶ A strategy pattern

# Admissible strategy patterns

## An admissible strategy pattern

- ▶ A strategy pattern + a total order on the edges s.t.
  - ▶ The order in the tree is satisfied
  - ▶ Each  $??m$  is preceded by some  $!!m$

# Admissible strategy patterns

**NOT ADMISSIBLE**

## An admissible strategy pattern

- ▶ A strategy pattern + a total order on the edges s.t.
  - ▶ The order in the tree is satisfied
  - ▶ Each  $??m$  is preceded by some  $!!m$

# Admissible strategy patterns

## An admissible strategy pattern

- ▶ A strategy pattern + a total order on the edges s.t.
  - ▶ The order in the tree is satisfied
  - ▶ Each  $??m$  is preceded by some  $!!m$

Checking whether there exists an order such that the strategy pattern is admissible can be done in polynomial time

# Solving REACH[L]

## How to use strategy patterns ?

### Soundness and correctness

A state is reachable in Reconfigurable Networks under a local strategy iff there is an admissible strategy pattern containing it.

# Solving REACH[L]

## How to use strategy patterns ?

### Soundness and correctness

A state is reachable in Reconfigurable Networks under a local strategy iff there is an admissible strategy pattern containing it.

### Minimization

If there exists an admissible strategy pattern containing  $q$ , then there exists one of polynomial size.

# Solving REACH[L]

## How to use strategy patterns ?

### Soundness and correctness

A state is reachable in Reconfigurable Networks under a local strategy iff there is an admissible strategy pattern containing it.

### Minimization

If there exists an admissible strategy pattern containing  $q$ , then there exists one of polynomial size.

### Theorem

REACH[L] is in NP for Reconfigurable Broadcast Networks.

# NP-hardness

- ▶ Reduction from 3SAT
- ▶ 3SAT formula  $\bigwedge_{i \in [1..k]} \ell_1^i \vee \ell_2^i \vee \ell_3^i$  over the variables  $\{x_1, \dots, x_r\}$

# NP-hardness

- ▶ Reduction from 3SAT
- ▶ 3SAT formula  $\bigwedge_{i \in [1..k]} \ell_1^i \vee \ell_2^i \vee \ell_3^i$  over the variables  $\{x_1, \dots, x_r\}$

- ▶ Locality  $\implies$  Uniform choice for  $x_i$  or  $\neg x_i$
- ▶ Local strategy  $\equiv$  Valuation
- ▶  $q_k$  reachable iff formula satisfiable

# NP-hardness

- ▶ Reduction from 3SAT
- ▶ 3SAT formula  $\bigwedge_{i \in [1..k]} \ell_1^i \vee \ell_2^i \vee \ell_3^i$  over the variables  $\{x_1, \dots, x_r\}$

- ▶ Locality  $\implies$  Uniform choice for  $x_i$  or  $\neg x_i$
- ▶ Local strategy  $\equiv$  Valuation
- ▶  $q_k$  reachable iff formula satisfiable

## Theorem

REACH[L] is NP-complete in Reconfigurable Broadcast Networks.

# Convergence Problem

## Target State Convergence (TARGET)

**Input:** A protocol and a set of control states  $T$ ;

**Output:** Does there exist  $\gamma \in \mathcal{C}_0$  and  $\gamma' \in \mathcal{C}$  s.t.  
 $\gamma \rightarrow^* \gamma'$  and  $\text{lab}(\gamma') \subseteq T$ ?

## Theorem

TARGET[L] is NP-complete in Reconfigurable Broadcast Networks.

### Idea of the proof:

- ▶ Again based on strategy patterns
- ▶ Refine the notion of admissibility: the order must ensure one can 'empty' nodes towards the target set
- ▶ Still polynomial size admissible trees

# Fully connected networks

## Clique topology

Every broadcast necessarily reaches all participants.

## Theorem

REACH[L] and TARGET[L] are undecidable in Clique Networks.

### Idea of the proof:

- ▶ Encode the behavior of a Minsky machine
- ▶ For TARGET[L], as for TARGET in Clique Networks
- ▶ For REACH[L]:
  - ▶ Simulate the same run twice
  - ▶ Locality forces to do the same simulation
  - ▶ The second run can use at most as many processes for the counters as in the first run
  - ▶ Clique topology guarantees increment/decrement by 1 only

# Undecidability of REACH[L] in Clique Networks

# How to regain decidability?

## A complete protocol

- ▶ From every state, at least one edge is labelled with an active action (internal or broadcast)
- ▶ From every state, for each message  $m$ , some edge is labelled with  $??m$

**Property of complete protocols in clique networks:  
at each broadcast, all processes change their past**

## Theorem

REACH[L] in Clique Networks of complete protocols is decidable.

### Idea of the proof:

- ▶ Abstraction: Represent processes with the same past by a single process
- ▶ Well-structured transition system

# Outline

- 1 Networks of reconfigurable broadcast protocols
- 2 Restricting to local strategies
- 3 Conclusion**

# Conclusion

## Local strategies in reconfigurable broadcast networks

### Adding locality assumption

- ▶ all processes behave the same
- ▶ reachability and convergence are NP-complete
- ▶ technical tool: strategy patterns
- ▶ polynomial cutoff on the number of processes needed
- ▶ undecidability for clique topology  
(unless restricting to complete protocols)
